Quantifiable, Objective Skill Management in Wipro through NFTs:

Current Problem:

- Manual, Subjective Skill management through Resume matching
- Transfer of skills between eHubs/GBLs is not tangible (a person will have multiple skills, when he moves from one eHub to another for a particular skill, he also takes away the other skills he has which the transferring eHub loses as a collateral, this cannot be tracked)

Solution:

- NFT based Quantifiable skill management at Organization level and also at Individual Level
- Each Individual accumulates NFTs for each skill
- Organization estimates its skill requirements for its business in terms of NFTs of that skill

Example:

Skill: Angular

Usecase 1: Organizational Skill estimation: Wipro needs X NFTs of Angular skill; Currently Wipro has accumulated Y NFTs of Angular skills; Gap of X-Y NFTs to be accumulated;

Usecase 2: Loan X NFTs of Angular from Americas-1 to Europe.

Usecase 3: Analytics and AI on top of this NFT for analytics and predictive/preventive solutions

Example skill: Angular

Angular NFTs	Angular NFT :Skill Units								
ACPNFT(200)	Capstone Project(multiple submodules used)								Skill Complexity L3
ASMNFT 1 to 3(1000 numbers)	sub-module 1(uses c1,c2,c3)			sub-module 2(c4,c5)		sub-module 3(uses c6,c7,c8)			Skill Complexity L2
ACNFT 1 to 8(5000 numbers)	Concept 1	Concept 2	Concept 3	Concept 4	Concept 5	Concept 6	Concept 7	Concept 8	Skill Complexity L1

Forgetting NFT or Forgetful NFT(NFT for the education sector) :

A skill learnt or knowledge acquired will keep diminishing. Looking at another way, there will be diminishing return on investment if we do not reskill ourselves.

As an individual, the NFT we accumulate also has to continuously keep losing its value (its value keeps coming down continuosly) unless it is refreshed again to its old value.

This way, if someone who accumulates the NFT, its value will start coming down eventually the value will stagnate at a lower threshold for that skill.

The NFT will also keep reducing its value until someone works on that skill through projects or trainings and refreshes it.

There are researches done in the medical/psychological fields where they estimates on the rate at which a human being forgets a knowledge or skill learnt. Or in business also there is a concept of diminishing returns and the rate at which the value is lost.

So, we can have NFT which loses its value and we can refresh its value by some action.
